Latitude and Longitude

The lines of latitude and longitude are the imaginary lines that are necessary to help us understand the location of places on the earth. They are measured in degrees and minutes. The parallel of latitude on the earth is the circle that is parallel to the equator. The distance of longitude on the earth is the distance from the equator to a degree and each degree of latitude is equal to about 69 miles (111 kilometers). In the equator, degrees of longitude are also approximately 69 kilometers apart. As they continue in the north, the length of the degree of longitude decreases. Latitude lines range from 90° in the north and south, with 0° at the equator (the Tropic of Cancer).

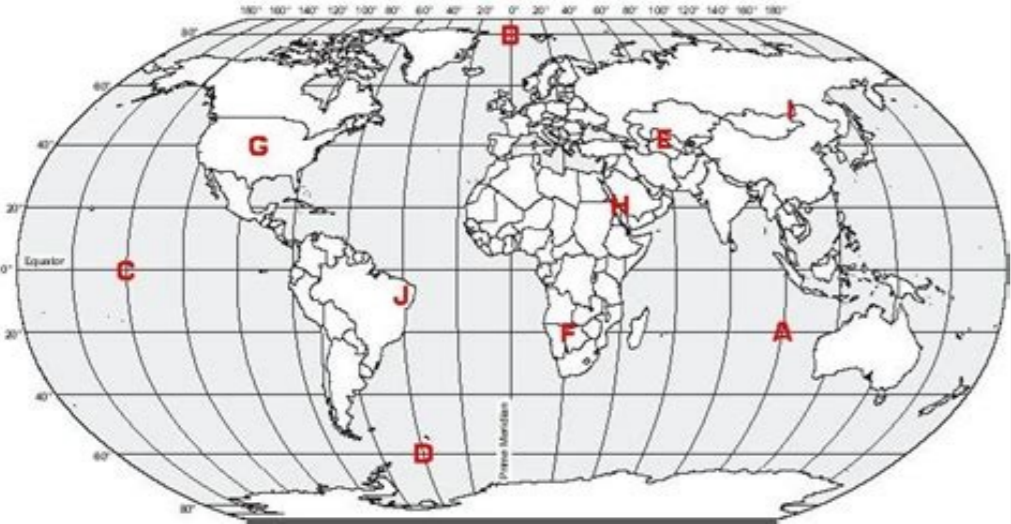

If you know the latitude and longitude of a place, you can use the information to determine approximate distance. They know the latitude or longitude lines which cross a location and how many the degree the 1° distance. (It is useful to approximate your location when you know that you are on the equator and then use to read of the Tropic of Cancer.)

Using the information above and the map on the next page, answer the following questions below.

1. Approximately how many kilometers is a degree of longitude at the equator? _____
2. Approximately how many kilometers long is 1° of latitude? _____
3. Approximately how many kilometers is a line of longitude at the Tropic of Cancer, the Arctic Circle, and the South Pole? _____
4. Approximately how far is it from the equator to the Tropic of Cancer? (Distance in the equator) _____
5. Approximately how far is it from the equator to the Arctic Circle? _____
6. How many kilometers on the map which is approximately 1° of latitude apart? _____
7. Write up the list your coordinates using long coordinates and long with a (long) _____

Name _____ Latitude and Longitude

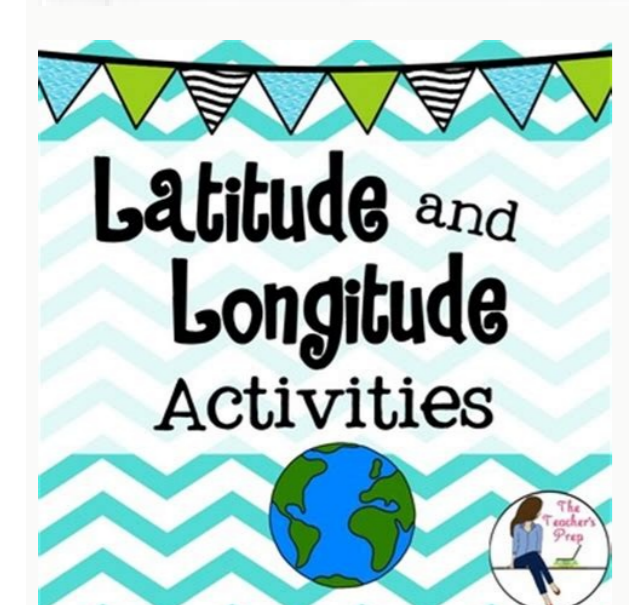

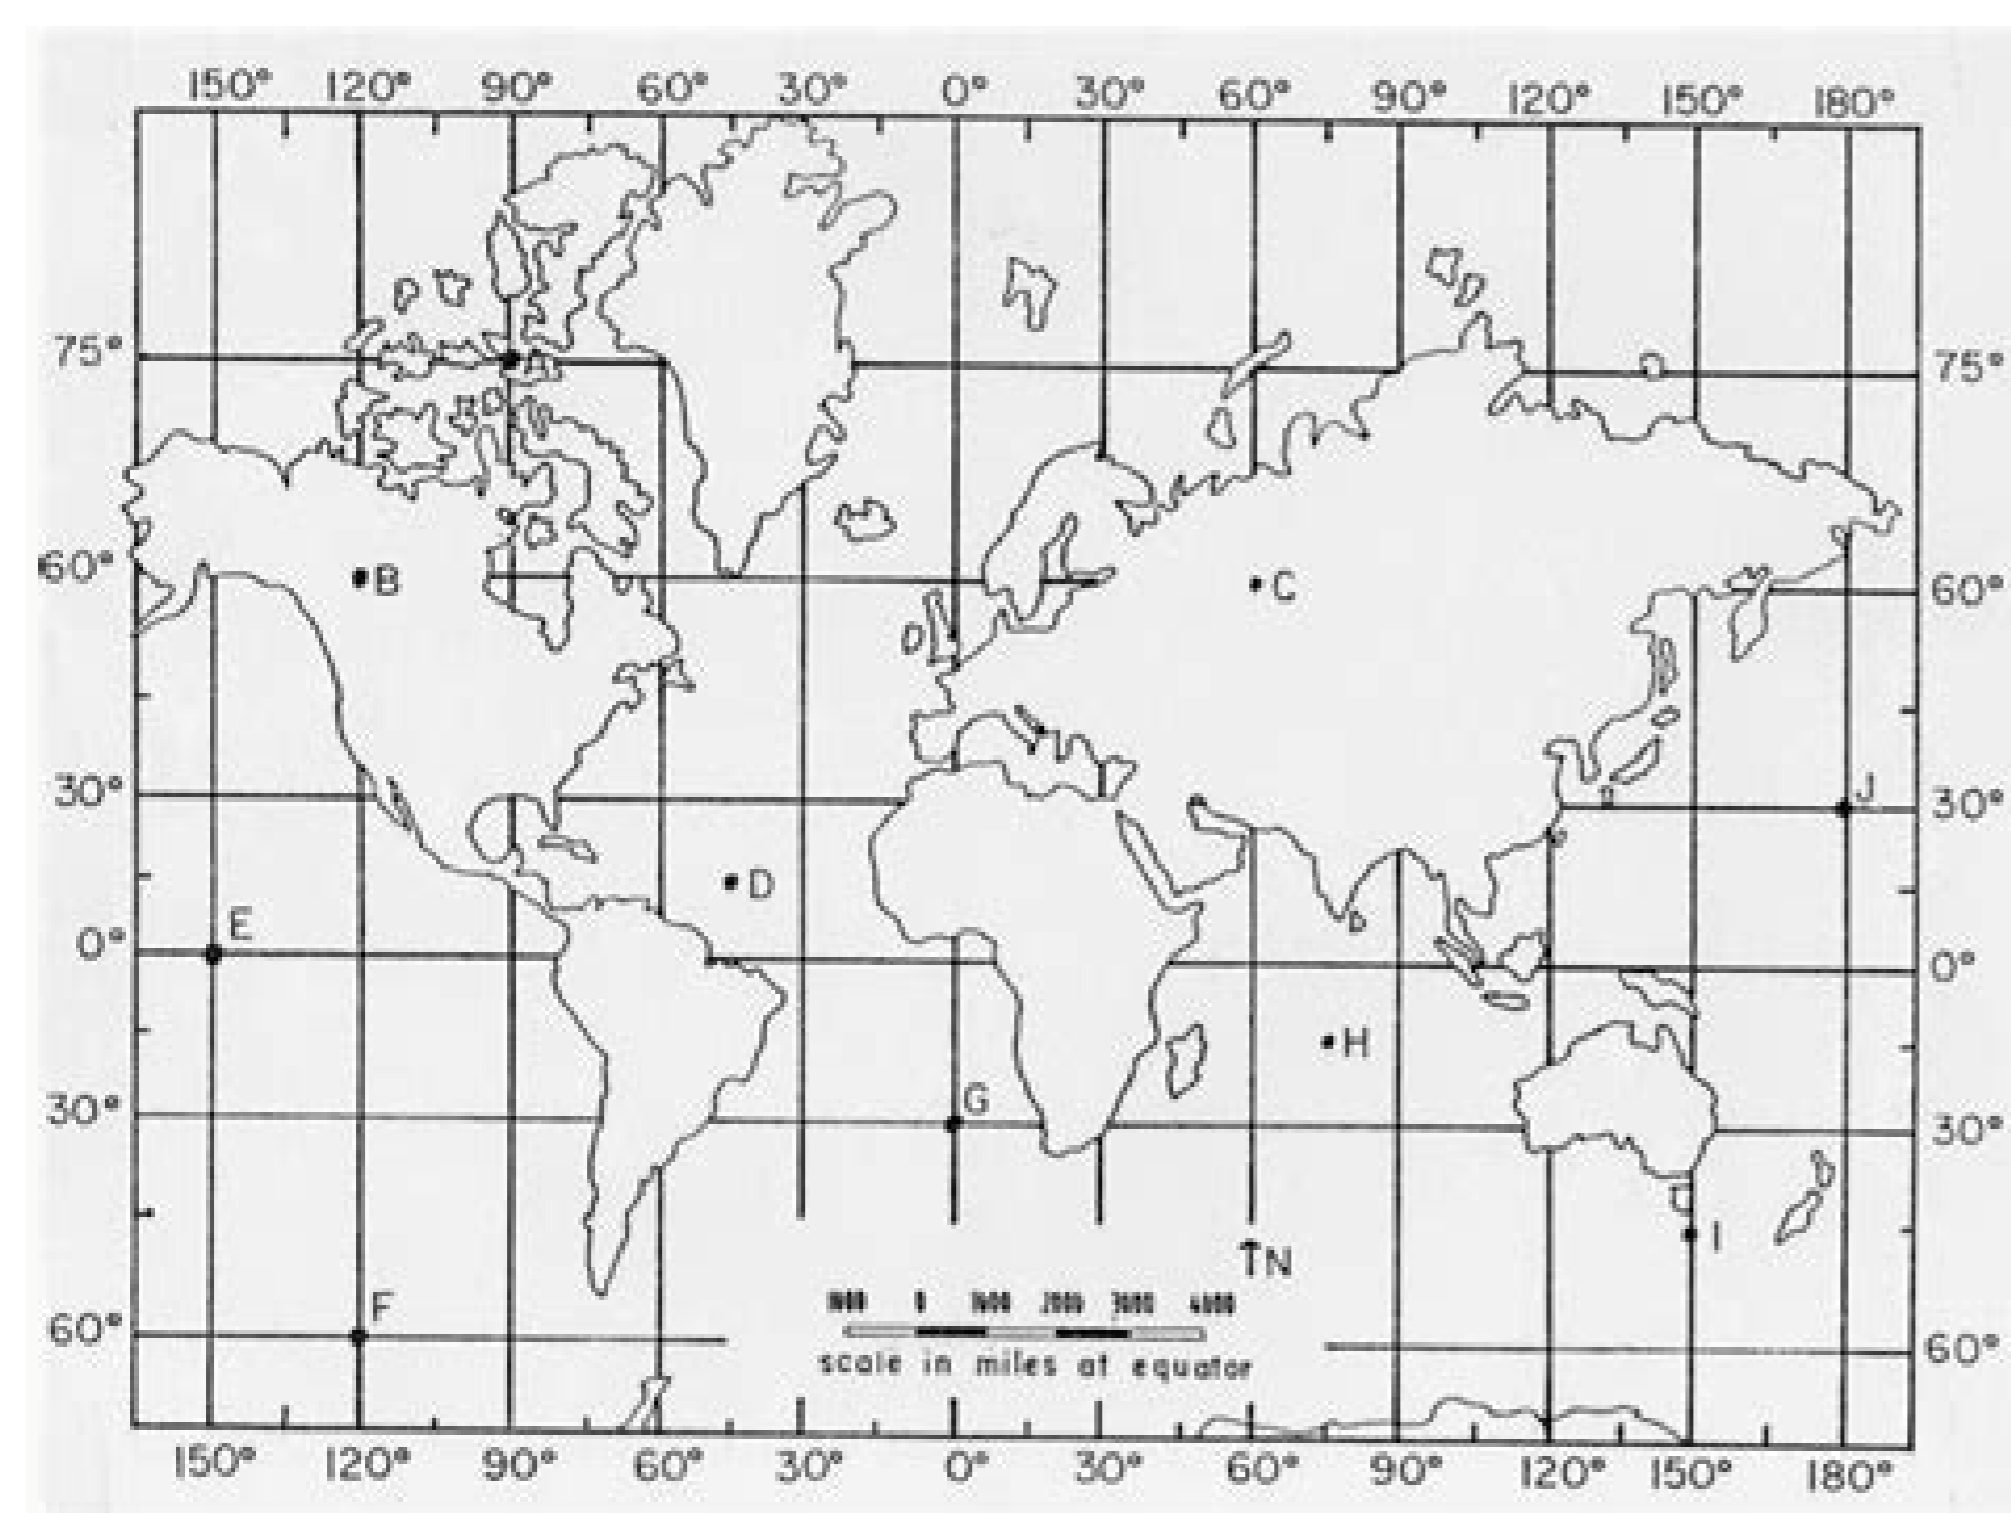

Latitude and Longitude

Suppose you had a blue ball with a small red X on it. Could you describe the location of this X? Without any other markings on the ball, your task would be almost impossible. Long ago, geographers also found it difficult to describe the location of places on Earth.

Lines that run around Earth in an east-west direction are called lines of latitude or parallels. Parallel lines are all the same distance apart from one another; they never meet. These lines are measured in degrees, shown by the symbol °. The best-known parallel, the equator, is 0°. Parallels north of the equator are marked in degrees north (N), and parallels south of the equator are marked in degrees south (S).

1. At about what degree of latitude is Vancouver? _____
2. Name a city that is north of the Arctic Circle. _____
3. Is most of Canada above or below the Arctic Circle? _____
4. What city is at about 55°N? _____
5. What parallel forms the northern border of four Canadian provinces? _____
